

Kentucky's Love for Contaminated Water

Hazardous Coal Ash Ponds and Water Contamination

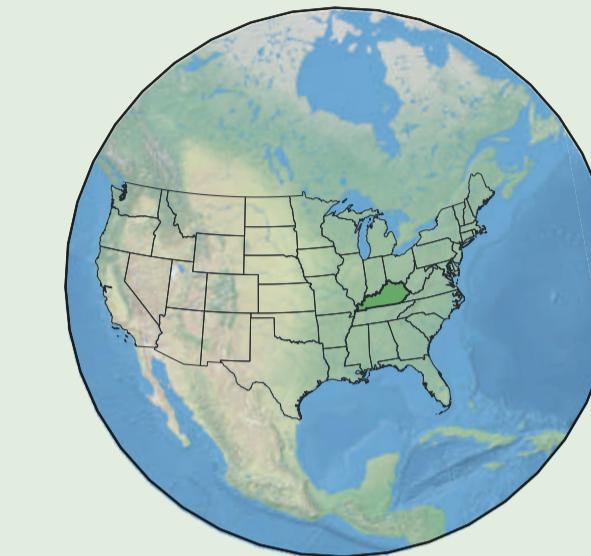

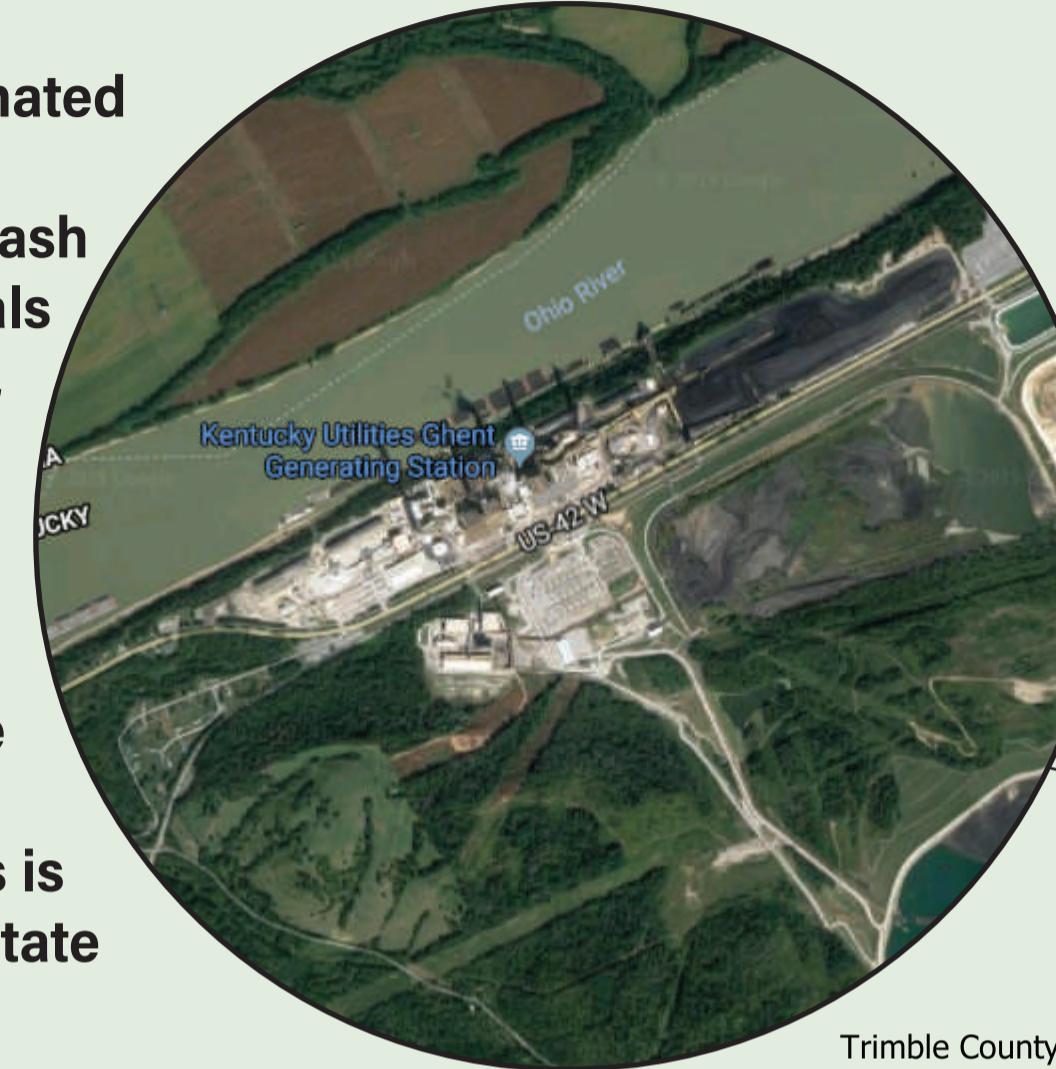

Kentucky Utilities Ghent Generating Station

is one of the most contaminated sites in the entire country.

The site has 5 unlined coal ash ponds that leech toxic metals like cobalt, lithium, arsenic, boron, molybdenum, and sulfate into the water at over 55 times the federal drinking water limit.

It is no coincidence that the population of low-income residents within three miles is estimated to be above the state average.

Kentucky in the Contiguous US
